

r2d2 'web'

resources..

- Elevate Web Builder (“ewb”)
 - (www.elevatesoftware.com)
 - Visual tool (windows based) for quickly building AJAX web applications. Includes an optional ‘ewb’ web and/or data server (can do either/both)
 - Made by same fellow who makes ‘DBISAM’, ‘Elevate DB’
- sTunnel (www.stunnel.org)
 - Tool for giving SSL ability to web tools that don’t have it. (example, https get redirected on the server to an http stream, and this occurs in both directions, thus securing the connection)

- What would be required
 - Set up a httpS site (on IIS) for testing purposes, using an SSL certificate. Ideally on the default httpS port (444)
 - Install and configure 'ewb server'. Port can be anything available, and is does not have to be open to the outside
 - Install and configure 'sTunnel'. This will re-direct traffic from the data httpS feed to the 'ewb' server. Incoming port can be anything available, but must be open to the outside
